TECHNICAL DATA

Belt Tensioning

V-Belt tensioning adjustment should be made using a tension meter or gauge, using the following procedure - seat the belt into groove and adjust center distance to take up slack. Operate the belt under load and increase tension further until only a slight bow on the slack side of the belt is apparent. Stop the drive and, using the tension meter, measure the force necessary to depress the belt 1/64" for every inch of belt span.

$$\text{Tension} = 1/64 \times \text{belt span.}$$

V-Belt deflection forces may vary from the initial run in at belt installation.

Belt Length Formula

- Motor Sheave Diameter (DR) + Driven (DN) Sheave Diameter x 1.57
- Add (2x) Center Distance, between DR and DN shafts
- Equals the belt's "Effective Length"

BELT WEAR/FAILURE RECOGNITION

Exposure to Oil & Grease
Cause: Belt swelling, exterior softness and bottom envelope seam to open/split.
Remedy: Splash Guards, don't over-lubricate, clean belts/sheaves.

Weathering or "Crazing"
Cause: Belt drive elements, as well as aggravation by small sheaves.
Remedy: Check tension, provide drive protection and replace belt(s).

Cut Bottom & Sidewall
Cause: Belt being pried over sheave during installation, as cut above indicates.
Remedy: Use proper length belts and tension properly when installing.

Severe Localized Wear
Cause: Spin burn caused by a frozen or locked drive sheave not able to turn freely.
Remedy: Determine that drive components turn freely and, if necessary, tighten belt.

Rough Sheave Sidewalls
Cause: Constant slippage due to belt being misaligned on worn sheaves.
Remedy: Use correct belt size. Align or replace sheaves.

Broken Belt
Cause: Rough sheaves and dust build-up can both cause belt failure and severe envelope wear.
Remedy: Shield the drive.

Snub Break
Cause: Cover wear indicates slippage and clean break reveals sudden snap due to non-proper drive tensioning.
Remedy: Maintain proper drive tension.

Abrasion
Cause: Sidewall wear a result of foreign material and rust in sheaves. Belt dropped to bottom of sheave groove.
Remedy: Dust guards to prevent abrasion.

Worn Side Pattern
Cause: Worn or misaligned sheaves.
Remedy: Retension drive to stop slipping, realign sheaves (replace if needed), replace belt if incorrect size.

Oil Deterioration
Cause: Rubber softened by excessive oil exposure, causing deterioration.
Remedy: Splash guards to protect drive against oil.

Cover Fabric Rupture
Cause: Fabric covering ruptured during installation due to belt being pried over belt sheave.
Remedy: Proper installation of belts.

Base Cracking
Cause: Loose tensioning. Belt slippage causes heat build-up and gradual under-cord hardening.
Remedy: New belt. Proper tensioning.

Distorted Belt
Cause: Distortion caused by broken cords or adhesive breakdown.
Remedy: Avoid prying on belts. Check sheaves for recommended diameters.

Ply Separation
Cause: Split along pitch line indicating belt ran on too small diameter of sheave.
Remedy: Install a (x) cogged type belt.

Ruptured Belt
Cause: Ruptured cords in the plies, caused by high shock load on foreign object between belt and sheave groove.
Remedy: Check tension, shield drive.

Slip Burn
Cause: Belt slipping under starting or stalling load.
Remedy: Replace belt and tighten drives until slipping stops.

MOLDED COGGED
Cogged allows smaller pulleys. Better head dissipation.

WEDGE COGGED
Cogged with smaller wedge operates on narrower pulley.

Belt sizes dimensions are nominal.

1. Cover - Rubberized Fabric

- Flexible, non-cracking, smooth running for long life.
- Oil, heat & abrasion resistant.

2. Load Section - Polyester Cords

- Positioned to take tension in both FHP & Classical applications.
- Chemically treated, then fused prevents separation.

3. Load Carrying Section

- Special compound to resist stretch & fatigue.

4. Compression Section

- Elastomer resists compression fatigue.
- Dissipates internal heat build-up.
- Provides firm lateral pressure against groove sidewall and distributes the load to cords.

TECHNICAL DATA

To assure maximum service from a drive, use the **Jason Sheave Gauge (Part Number G001)** (Fig. 1) to inspect sheaves every time a belt is replaced.

- Inspect for burrs or rough spots along the sheave rim.
- Check to make sure side walls are not dished out (Fig. 2). On multiple belt drive, it is essential that all grooves have no wear. Wear on one groove and not another will create “differential driving” (Fig. 3) and is equivalent to running a mismatched set of belts.
- Check for shiny grooves in sheave. Shiny grooves indicate a worn spot that will wear replacement belt.
- Check the alignment of sheaves and that the shafts are parallel.

Failure to replace a worn sheave will result in poor performance and premature failure of the drive belt.
